

Statusreport SEL 15/4

This week we were able to solely work on our stories. We have been able to finish all of our stories. After the dev review by our customers however, some issues have arisen. Below you will find a summary. A summary for the stories which we had to implement can be found on our last status report.

PSE-15: Not yet been reviewed by our customer

Amount of effort for this story was OK. Main issues were getting the connection between the front- and backend to work.

Raphael: Code implementation 8 Hours; Studying required technologies 1 hour

Luca : Code implementation 2 hours; Understanding code 2 hours

PSE-15: Reviewed by customer

This story was implemented and finished. All acceptance criterias were fulfilled. After the dev review by our customer however, they told us that even though our version works, they want a different kind of implementation. Much of our logic happens in the frontend. They want the logic to happen in the backend however.

Marko: Reduce database due to overwhelmed machine 2 hours; Understanding of the frontend 5 hours; Code implementation 21 hours

Marco: Code implementation 14 hours; Understanding backend 4 hours

PSE-16: Reviewed and accepted by customer

PSE-17: Partially reviewed by customer

The idea for a mobile version of the date-picker exists, though there exists a problem: The date picker from Element-UI is very restrictive. The source code cannot be changed. Due to this we will have to find a workaround, which may result in a less pretty or no solution at all.

Severin: Working on prototype 30 hours; working on the video demo for PSE 10 hours

We met with our customers on the 12th of April to discuss further stories to implement. We have met on the 14th with our team internally to discuss assignments of the stories and problems that have arisen or may arise. Raphael, Luca, Marko and Severin will work on our newly assigned stories while Marco will rewrite PSE-15 to adjust to the customers wishes.

The project is still well on its way.
